

# Sapflow-Measurement PROSA APP

Just a few clicks  
from raw data to  
Sapflow density

run

PROSA

Depending on the measuring method, the evaluation of the raw data to calculate sapflow density requires additional effort.

New PROSA-App is a web application which makes the evaluation and visualization of sapflow measurement data more comfortable and easier:

- **Import** directly from WebVis Portal or upload your own file
- **Select** measurement-method/evaluation formula  
Starting with Graniers Formular (UP SFS2)  
Dynamax-TDP, SF4, SF-L, CTG and NTG will follow
- **Configure** data channel and parameters from formular
- **Check** Night-Maxima details and daily sensor behaviour  
Graphics show results in different layouts
- **Compare** graphics of Sapflow Density with other measured data like PAR Radiation, Temperture etc  
Synchronized zooming (changing the time axis) and scrolling makes it possible to compare different data series in detail. This is a big benefit while interpreting sapflow data.
- **Save** your results into Excel file for download

Just a few clicks from raw-data to sapflow-density:
